## PRODUCT OVERVIEW

The EQ-P3B is modeled on a legendary passive equalizer developed in the 1950s. It is one of the most appreciated and iconic equalizers in audio production and has had a great influence on the sound design of many music productions. Some functions have been changed to the EQ-P3B to make it even more universally applicable.

Features:

- **IN:** Switches equalization in and out but leaves the analog modeling.
- **Trim:** Trims the EQ level by  $\pm 18$  dB.
- **Low Band Boost:** 0 to 18 dB.
- **Low Band Atten:** 0 to 20 dB.
- **Low Band Frequency (CPS):** 20Hz, 30Hz, 60Hz, 100Hz.
- **Hi Bell Frequency (KCS):** 3kHz, 4kHz, 5kHz, 8kHz, 10kHz, 12kHz, 16kHz.
- **Hi Bell Boost:** 0 to 18 dB.
- **Hi Bell Bandwidth (Q):** 0 to 10. Modified with constant peak gain.
- **High Shelf Atten:** 0 to 20 dB.
- **High Shelf Frequency (Atten Sel):** 5kHz, 10kHz, 20kHz.
- **Power:** Turns the EQ with analog modeling on/off.
- **Menu:** Top left. First option to toggle **show tooltip** on and off for all instances in the project. Second option to toggle **sample accurate automation** on and off for this instance. You should enable sample exact automation if you are automating this instance with an envelope in the Track Control Panel. If this option is enabled, sample exact automation will be applied during playback and rendering, no matter how large the block size is set. The third option turns the **automatic bypass on playback stop** on and off for all instances in the project. The option is useful if you have many instances in the project, then you can save some CPU consumption in the playback pauses. There is another way to auto-bypass the plugin and save CPU. If you activate the option "**Auto-bypass FX that report tail length or have auto-tail set**" in **Project settings->Advanced**, the plugin will be turned off automatically when it receives no audio signal and the GUI is closed. As soon as the plugin receives an audio signal or the GUI is opened, it is automatically switched on.
- **GUI scaling:** Triangle bottom right. GUI freely scalable.

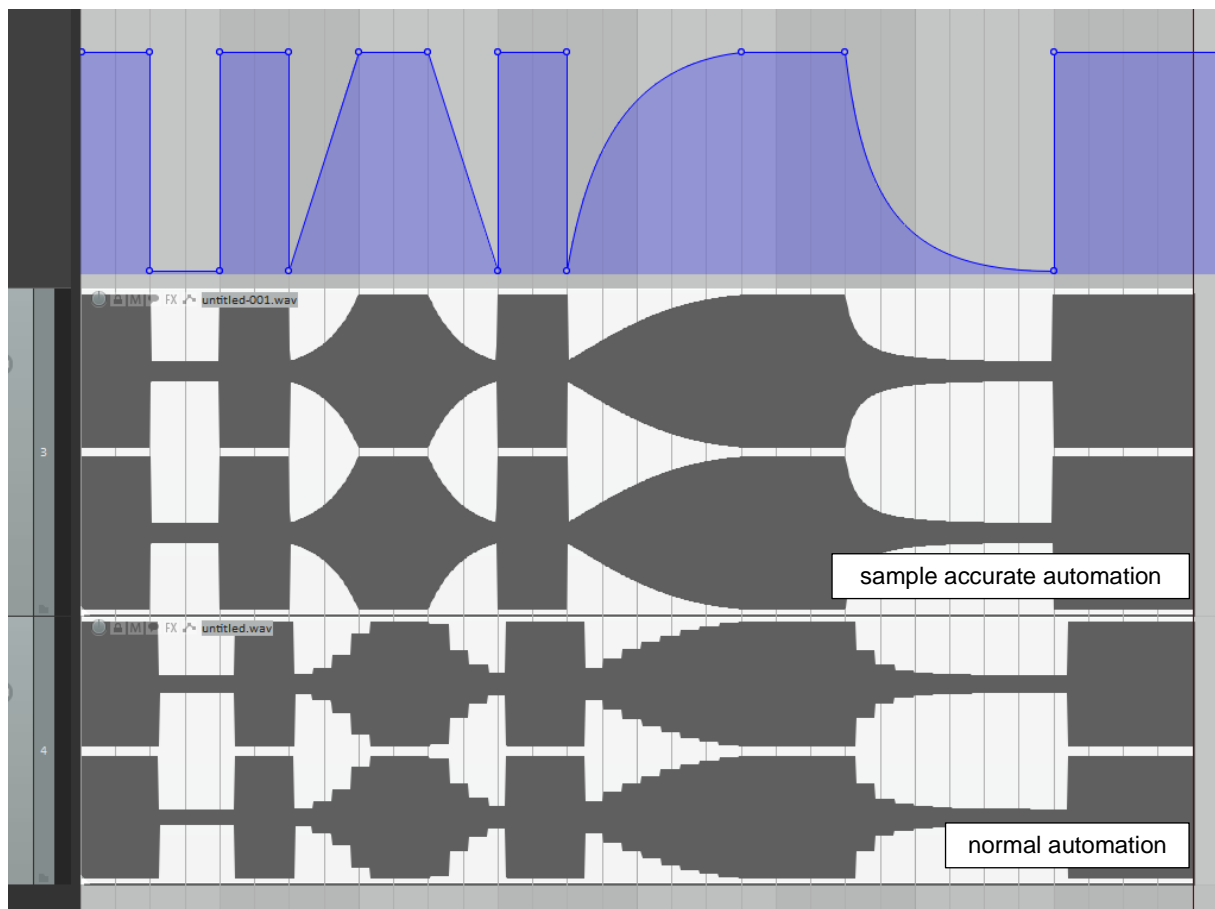

### Minimum system requirements:

Monitor with 960x182 pixel resolution,

**Attention:** This is a JSFX and not a VST, AU or AAX.
